Annotation

There is no doubt that the topic of the master's thesis is one of the most discussed and sensitive topics both in the world and in Georgia due to its scale. With the development of civilization, the issue of climatic anomalies is becoming more and more relevant and can be said to be problematic. Therefore, the main goal of the work is to firstly identify this or that anomaly and then to show better the connections that exist between the landscapes on the one hand and these climatic anomalies (geographic features) on the other hand. One of the main goals of the work is also to reveal the changed landscapes due to the impact of climatic anomalies and the impact of the latter on the society and living beings in general, and of course predictions. Future forecasts help us to see the reality that may be on earth in the near future (if some radical measures are not taken)
